

JTC Campaign Reliability Diagram (question-level)

n=786 individually-scored questions with a resolved outcome across 72 matches. Binning: isotonic regression (CORP-style, no manually chosen bin count -- Dimitriadis, Gneiting & Jordan 2021, PNAS). Band: 1000-resample bootstrap, seed=42, matching ml/platt_diagnostic.py's own convention. This diagram answers a different question from the campaign-trajectory charts (cumulative_rbp_drawdown.png, match_rbp_waterfall.png): are submitted probabilities well-calibrated, independent of match date or RBP scale.
